

## PRINTER

ABSTRACT OF THE DISCLOSURE

A printer, comprises for forming an image on a surface of a recording media: preprocessing means for preprocessing the surface of the recording media to form an image on the surface of the recording media; post-processing means for post-processing the surface of the recording media preprocessed by the preprocessing means to form the image on the surface of the recording media; a recording media feed path formed between the preprocessing means and the post-processing means; first feed means arranged on an upstream side of the recording media feed path; and, second feed means arranged on a downstream side of the recording media feed path; wherein the first feed means and the second feed means are made different in driving control from each other. For printing a plurality of recording media successively, no large-scale arrangements are provided for printing processes to meet a required printing accuracy and to shorten a processing time.
